

The Steel gutter system is self-healing

- When the steel is exposed to moisture and oxygen, i.e. **normal atmosphere**, it forms a galvanic element
- Negatively charged zinc ions are attracted by the positively charged steel
- The zinc ions wander over and protect exposed steel from corrosion in scratches and edges
- This process is very slow and continues for decades
- More than 40 years of global testing in the harshest weather conditions possible
- The color coated steel has been exposed year-round to saltwater, snow, ice, rain, UV radiation, high humidity, wind and storms, proving its superior quality
